## ON A PROBLEM OF PÁLFY AND SAXL

#### WILLIAM DEMEO

### 1. Introduction

In the paper [1], Péter Pálfy and Jan Saxl pose the following

PROBLEM. Let **A** be a finite algebra with Con  $\mathbf{A} \cong M_n$ ,  $n \geqslant 4$ . If three nontrivial congruences of **A** pairwise permute, does it follow that every pair of congruences of **A** permute?

These notes collect some notation and facts that might be useful for attacking this problem. Throughout, X denotes a finite set,  $\operatorname{Eq}(X)$  denotes the lattice of equivalence relations on X and, for  $\alpha \in \operatorname{Eq}(X)$  and  $x \in X$ , we denote by  $x/\alpha$  the equivalence class of  $\alpha$  containing x. We often refer to equivalence classes as "blocks," and we denote by  $\#\operatorname{Blocks}(\alpha)$  the number of blocks of the equivalence relation  $\alpha$ .

For a given  $\alpha \in \text{Eq}(X)$  the map  $\varphi_{\alpha} : x \mapsto x/\alpha$  is a function from X into the power set  $\mathscr{P}(X)$  with kernel  $\ker \varphi_{\alpha} = \alpha$ . The block-size function  $x \mapsto |x/\alpha|$  is a function from X into  $\{1, 2, \ldots, |X|\}$ .

We will often abuse notation and equate an equivalence relation with the corresponding partition of the set X. For example, we will equate the relation

$$\alpha = \{(0,0), (1,1), (2,2), (3,3), (0,1), (1,0), (2,3), (3,2)\}$$

with the partition [0,1|2,3], and often we resort to writing  $\alpha=[0,1|2,3]$ .

We say that  $\alpha$  has uniform blocks if all blocks of  $\alpha$  have the same size; or, equivalently, the block-size function is constant: for all  $x, y \in X$ ,  $|x/\alpha| = |y/\alpha|$ . We will use  $|x/\alpha|$ , without specifying a particular  $x \in X$ , to denote this block size. Thus, when  $\alpha$  has uniform blocks, we have  $|X| = |x/\alpha| \cdot \# \text{Blocks}(\alpha)$ .

We say that two equivalence relations with uniform blocks have *complementary* uniform block structure, or simply complementary blocks, if the number of blocks of one is equal to the block size of the other. In other words, if  $\alpha$  and  $\beta$  are two equivalence relations on X with uniform block sizes  $|x/\alpha|$  and  $|x/\beta|$ , respectively, then  $\alpha$  and  $\beta$  have complementary blocks if and only if  $(\forall x)(\forall y)|x/\alpha| \cdot |y/\beta| = |X|$ .

Given two equivalence relations  $\alpha$  and  $\beta$  on X, the relation

$$\alpha \circ \beta = \{(x, y) \in X^2 : (\exists z) x \alpha z \beta y\}$$

is called the *composition of*  $\alpha$  *and*  $\beta$ , and if  $\alpha \circ \beta = \beta \circ \alpha$  then  $\alpha$  and  $\beta$  are said to permute, or to be permuting equivalence relations. Note that  $\alpha \circ \beta \subseteq \alpha \vee \beta$  with equality if and only if  $\alpha$  and  $\beta$  permute.

The largest and smallest equivalence relations on X are  $1_X = X^2$  and  $0_X = \{(x, x) : x \in X\}$ , respectively.

 $Date \hbox{: November 13, 2013.}$ 

One more piece of shorthand notation will be useful below. Suppose  $\Theta$  is a set of equivalence relations that are *pairwise permuting pairwise complements* (pairwise permuting pairwise complements (PPPC))—that is, for all  $\gamma \neq \delta$  in  $\Theta$ , we have

$$\gamma \circ \delta = \delta \circ \gamma$$
,  $\gamma \wedge \delta = 0_X$ ,  $\gamma \vee \delta = 1_X$ .

Then we say that the relations in  $\Theta$  are PPPC.

### 2. Basic observations

We say that  $\alpha$  and  $\beta$  are complementary equivalence relations on X provided  $\alpha \vee \beta = 1_X$  and  $\alpha \wedge \beta = 0_X$ .

**Lemma 1.** Suppose  $\alpha$  and  $\beta$  are complementary equivalence relations on X. Then  $\alpha$  and  $\beta$  permute if and only if they have complementary blocks. That is,

$$\alpha \circ \beta = 1_X \iff (\forall x)(\forall y) |x/\alpha| \cdot |y/\beta| = |X|.$$

**Corollary 1.** Suppose  $\alpha_1$ ,  $\alpha_2$ ,  $\alpha_3$  are pairwise complementary equivalence relations on X. Then  $\alpha_1$ ,  $\alpha_2$ ,  $\alpha_3$  pairwise permute if and only if they all have uniform blocks of size  $\sqrt{|X|}$ . In other words,

$$(\forall i)(\forall j) \, (i \neq j \longrightarrow \alpha_i \circ \alpha_j = 1_X) \quad \Longleftrightarrow \quad (\forall i)(\forall x) \, |x/\alpha_i| = \sqrt{|X|}.$$

In this case, we clearly have  $|x/\alpha_i| = \#\text{Blocks}(\alpha_i)$ .

*Proof of Lemma 1.* Assume  $\alpha \circ \beta = \alpha \vee \beta = 1_X$ . Then, for all  $x \in X$  we have

(2.1) 
$$x/(\alpha \circ \beta) = \coprod_{y \in x/\alpha} y/\beta = X,$$

where  $\coprod$  denotes disjoint union. The union is disjoint since  $\alpha \wedge \beta = 0_X$ . Since the union in (2.1) is all of X, every block of  $\beta$  must appear in the union, so the block  $x/\alpha$  has exactly  $\#\text{Blocks}(\beta)$  elements. Since x was arbitrary,  $\alpha$  has uniform blocks of size  $|x/\alpha| = \#\text{Blocks}(\beta)$ . Similarly,  $x/(\beta \circ \alpha) = \coprod_{y \in x/\beta} y/\alpha = X$ , so  $|x/\beta| = \#\text{Blocks}(\alpha)$  holds for all  $x \in X$ . Therefore, for all  $x, y \in X$ , we have

$$|x/\alpha| \cdot |y/\beta| = |x/\alpha| \cdot \# \text{Blocks}(\alpha) = |X|$$

To prove the converse, suppose  $\alpha$  and  $\beta$  are pairwise complements with complementary blocks. Then  $|x/\alpha| \cdot |y/\beta| = |X|$ , thus  $|y/\beta| = |x/\alpha|^{-1} \cdot |X| = \# \mathrm{Blocks}(\alpha)$  hold for all  $x, y \in X$ . Therefore, for all  $x \in X$ , we have

$$|x/(\alpha \circ \beta)| = |\prod_{y \in x/\alpha} y/\beta| = \sum_{y \in x/\alpha} |y/\beta|$$
$$= \sum_{y \in x/\alpha} \#\text{Blocks}(\alpha)$$
$$= |x/\alpha| \#\text{Blocks}(\alpha) = |X|.$$

This proves that  $\alpha \circ \beta = 1_X$ , as desired.

Proof of Corollary 1. Since  $\alpha_1$  and  $\alpha_2$  permute and are complements, Lemma 1 implies they have complementary blocks, so

(2.2) 
$$|x/\alpha_1| = |x/\alpha_2|^{-1} \cdot |X| = \#\text{Blocks}(\alpha_2).$$

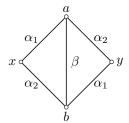

FIGURE 1. The Wheatstone Bridge which defines the relation  $\tau(\alpha_1, \alpha_2, \beta)$  as follows:  $(x, y) \in \tau(\alpha_1, \alpha_2, \beta)$  if and only if there exist  $a, b \in X$  satisfying the relations in the diagram.

(This holds for all  $x \in X$ . Recall that complementary blocks are always uniform.) Similarly, since  $\alpha_1$  and  $\alpha_3$  permute, we have  $|x/\alpha_1| = |x/\alpha_3|^{-1} \cdot |X| = \#\text{Blocks}(\alpha_3)$ . Therefore,  $\#\text{Blocks}(\alpha_2) = \#\text{Blocks}(\alpha_3)$ . Since  $\alpha_2$  and  $\alpha_3$  permute, we have

(2.3) 
$$|x/\alpha_2| = |x/\alpha_3|^{-1} \cdot |X| = \#\text{Blocks}(\alpha_3),$$

and the latter is equal to  $\#Blocks(\alpha_2)$ . Therefore,

$$|X| = |x/\alpha_2| \cdot \# \text{Blocks}(\alpha_2) = |x/\alpha_2| \cdot |x/\alpha_2|.$$

Thus,  $|x/\alpha_2| = \sqrt{|X|}$ , so by (2.2) and (2.3) we have  $|x/\alpha_i| = \sqrt{|X|} = \#\text{Blocks}(\alpha_i)$  for i = 1, 2, 3.

The converse is obvious, since if  $\alpha_i$  and  $\alpha_j$  are complementary equivalence relations on X with  $|x/\alpha_i| = \sqrt{|X|}$ , then  $\#\text{Blocks}(\alpha_i) = \sqrt{|X|}$ , so  $\alpha_i \circ \alpha_j = 1_X$ .  $\square$ 

From Corollary 1 we see that the Pálfy-Saxl problem can be stated as

PROBLEM. Let **A** be a finite algebra with Con  $\mathbf{A} \cong M_n$ ,  $n \geqslant 4$ . If three atoms of **A** have Property (2.4) below, does it follow that every atom has Property (2.4)?

(2.4) 
$$(\forall x) |x/\alpha| = \sqrt{|X|} = \#\text{Blocks}(\alpha)$$

To prove that the answer is "yes," it will suffice to prove that if  $M_n \leq \text{Eq}(X)$  has 3 atoms with Property (2.4) and an atom  $\beta$  with  $|x/\beta| < \sqrt{|X|}$ , then this  $M_n$  is not a congruence lattice.

### 3. Graphical Compositions

Suppose  $\alpha_1$ ,  $\alpha_2$ , and  $\alpha_3$  are pairwise permuting pairwise complements (PPPC) in Eq(X), and let  $\beta \in \text{Eq}(X)$  be complementary to each  $\alpha_i$ , so that

$$L = \{0_X, \alpha_1, \alpha_2, \alpha_3, \beta, 1_X\} \cong M_4.$$

Define the relation  $\tau = \tau(\alpha_1, \alpha_2, \beta) \subseteq X \times X$  as follows:

$$x \tau y \longleftrightarrow (\exists (a,b) \in \beta) \ x \alpha_1 \ a \alpha_2 \ y \alpha_1 \ b \alpha_2 \ x.$$

Graphically,  $x \tau y$  if and only if there exist  $a, b \in X$  satisfying the relations depicted in Figure 1.

It is clear that  $\tau$  is a tolerance, that is, a reflexive and symmetric binary relation. Let  $f \in X^X$  be a unary function and suppose that f is compatible with each relation  $\theta \in \{\alpha_1, \alpha_2, \beta\}$ , that is,  $(u, v) \in \theta \longrightarrow (f(u), f(v)) \in \theta$ . Then f is also compatible with  $\tau$ . (Consider the diagram in Figure 1, and give each vertex u the label f(u).)

**Fact 3.1.** If 
$$L = \{0_X, \alpha_1, \alpha_2, \alpha_3, \beta, 1_X\} \cong M_4$$
, then

$$\alpha_1 \cap \tau(\alpha_1, \alpha_2, \beta) = 0_X = \alpha_2 \cap \tau(\alpha_1, \alpha_2, \beta),$$
  

$$\alpha_1 \cap \tau(\alpha_1, \alpha_3, \beta) = 0_X = \alpha_3 \cap \tau(\alpha_1, \alpha_3, \beta),$$
  

$$\alpha_2 \cap \tau(\alpha_2, \alpha_3, \beta) = 0_X = \alpha_3 \cap \tau(\alpha_2, \alpha_3, \beta).$$

*Proof.* Fix  $(x,y) \in \alpha_1 \cap \tau(\alpha_1, \alpha_2, \beta)$  and suppose a and b satisfy the diagram in Figure 1. Then  $(x,y) \in \alpha_1$  implies  $(a,b) \in \alpha_1 \wedge \beta = 0_X$ , so a = b. Therefore,  $(x,y) \in \alpha_1 \wedge \alpha_2 = 0_X$ , so x = y. Proofs of the other identities are similar.

### 4. Functions Derived from Graphical Compositions

Let  $R_{12}^{\beta}$  be the relation on  $X^2 \times X^2$  defined by

$$(a,b)$$
  $R_{12}^{\beta}(x,y)$   $\longleftrightarrow$   $(a,b) \in \beta$  and  $x \alpha_1 \ a \alpha_2 \ y \alpha_1 \ b \alpha_2 \ x$ .

Define  $R_{13}^{\beta}$  and  $R_{23}^{\beta}$  similarly. Graphically, (a,b)  $R_{12}^{\beta}$  (x,y) holds if and only if the relations in Figure 1 are satisfied.

**Lemma 2.** Suppose  $\alpha_i$  and  $\alpha_j$  are complementary equivalence relations on X with uniform blocks of size  $\sqrt{|X|}$ . Then the relation  $R_{ij}^{\beta}$  restricted to  $\beta \times X^2$  is a one-to-one function from  $\beta$  into  $X^2$ .

*Proof.* First we note that each pair  $(a,b) \in \beta$  has at most one image. For if (a,b)  $R_{ij}^{\beta}$  (x,y) and (a,b)  $R_{ij}^{\beta}$  (u,v), then  $(x,u) \in \alpha_i \wedge \alpha_j = 0_X$  and  $(y,v) \in \alpha_i \wedge \alpha_j = 0_X$ , so (x,y) = (u,v).

Next, since both  $\alpha_i$  and  $\alpha_j$  have  $\sqrt{|X|}$  blocks, and since each of these blocks has size  $\sqrt{|X|}$ , we see that each block of  $\alpha_i$  intersects each block of  $\alpha_j$  at exactly one point. That is, for all  $a,b\in X$ , the set  $a/\alpha_i\cap b/\alpha_j$  is a singleton. Therefore, to each  $(a,b)\in\beta$  there corresponds precisely one  $(x,y)\in X^2$  such that (a,b)  $R_{ij}^\beta(x,y)$  holds. Specifically,  $\{x\}=a/\alpha_i\cap b/\alpha_j$  and  $\{y\}=b/\alpha_i\cap a/\alpha_j$ . Thus,  $R_{ij}^\beta$  is a function.

From now on, we let  $R_{ij}^{\beta}((a,b))$  denote the image of (a,b) under  $R_{ij}^{\beta}$ ; that is,  $R_{ij}^{\beta}((a,b))$  denotes the ordered pair (x,y) satisfying (a,b)  $R_{ij}^{\beta}(x,y)$ .

Suppose 
$$R_{ij}^{\beta}((a,b)) = R_{ij}^{\beta}((c,d))$$
. Then  $(a,c) \in \alpha_i \wedge \alpha_j = 0_X$  and  $(b,d) \in \alpha_i \wedge \alpha_j = 0_X$ , so  $(a,b) = (c,d)$ . Therefore,  $R_{ij}^{\beta}$  is one-to-one.

If, in addition to the assumptions of Lemma 2, we assume that the image of  $\beta$  under  $R_{ij}^{\beta}$  is contained in  $\beta$ , then  $R_{ij}^{\beta}:\beta\to\beta$  is a bijective involution. That is,  $R_{ij}^{\beta}$  is one-to-one and onto, and  $R_{ij}^{\beta}\circ R_{ij}^{\beta}$  is the identity map.

# 5. Final piece of the puzzle

As above, suppose  $L = \{0_X, \alpha_1, \alpha_2, \alpha_3, \beta, 1_X\} \cong M_4$  is a congruence lattice with  $\alpha_i$  PPPC. Suppose  $R_{ij}^{\beta} : \beta \to \beta$  holds for all  $i, j \in \{1, 2, 3\}$ .

**Lemma 3.** If  $a \alpha_1 z \beta w$ , then one of the following holds:

- $(1) (a, w) \in \alpha_2,$
- $(2) (a, w) \in \alpha_3,$

- $(3) (a, w) \in \beta$ ,
- (4)  $a/\alpha_2 \cap z/\alpha_3 \cap w/\alpha_1 \neq \emptyset$ ,
- (5)  $a/\alpha_3 \cap z/\alpha_2 \cap w/\alpha_1 \neq \emptyset$ .

If Lemma 3 is true, then we can prove the following:

**Theorem 1.** If  $L = \{0_X, \alpha_1, \alpha_2, \alpha_3, \beta, 1_X\} \cong M_4$  is a congruence lattice with  $\alpha_i$  PPPC, then  $\beta$  permutes with each  $\alpha_i$ .

*Proof.* We will show  $\alpha_1 \circ \beta \subseteq \beta \circ \alpha_1$ . Assume  $a \alpha_1 z \beta w$ . We consider each of the cases in Lemma 3 in turn and, in each case, find b satisfying  $a \beta b \alpha_1 w$ .

- (1) If  $(a, w) \in \alpha_2$ , then let  $b = z/\alpha_2 \cap w/\alpha_1$ . Then  $R_{12}^{\beta}(z, w) = (a, b)$  and since  $R_{12}^{\beta}: \beta \to \beta$ , we have  $(a, b) \in \beta$ , so  $a \beta b \alpha_1 w$ , as desired.
- (2) If  $(a, w) \in \alpha_3$ , then let  $b = z/\alpha_3 \cap w/\alpha_1$ . Use the same argument as in the first case, but replace  $R_{12}^{\beta}$  with  $R_{13}^{\beta}$ .
- (3) If  $(a, w) \in \beta$ , then let b = a.
- (4) If  $a/\alpha_2 \cap z/\alpha_3 \cap w/\alpha_1 \neq \emptyset$ , then let y denote the element in this set. Let  $x = z/\alpha_1 \cap w/\alpha_3$ , and let  $b = x/\alpha_2 \cap y/\alpha_1$ . Then  $(R_{12}^{\beta} \circ R_{13}^{\beta})(z,w) = R_{12}^{\beta}(x,y) = (a,b)$ , so  $(a,b) \in \beta$ . Now,  $b \alpha_1 y \alpha_1 w$ , so  $a \beta b \alpha_1 w$ , as desired.
- (5) If  $a/\alpha_3 \cap z/\alpha_2 \cap w/\alpha_1 \neq \emptyset$ , then let y denote this element, let  $x = z/\alpha_1 \cap w/\alpha_2$ , and let  $b = x/\alpha_3 \cap y/\alpha_1$ . Then  $(R_{13}^{\beta} \circ R_{12}^{\beta})(z,w) = R_{12}^{\beta}(x,y) = (a,b)$ , so  $(a,b) \in \beta$ . Now,  $b \alpha_1 y \alpha_1 w$ , so  $a \beta b \alpha_1 w$ , as desired.

# 6. Proof of Lemma 3

Consider the relation  $\theta_{ij}$  defined as follows:

$$x \theta_{ij} y \longleftrightarrow (\exists a, b) a \alpha_i x \alpha_j b \beta y \alpha_j a.$$

Easy arguments similar to those above establish that

$$\theta_{ij} \cap \alpha_i = \theta_{ij} \cap \alpha_j = \theta_{ij} \cap \beta = 0_X.$$

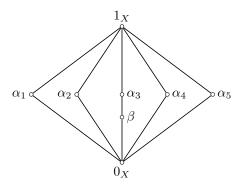

On the other hand, since L is a congruence lattice, it must be the case that the transitive closure of  $\theta_{ij}$  is contained in L.

TODO: prove of Lemma 3 (if possible).

### APPENDIX A. EXAMPLE

Let X be a set. It is useful to represent partitions of X as lists of lists, and write them as (possibly nonrectangular) arrays, where each row represents a single block. We do this in the following example, which aids our intuition when thinking about the Palfy-Saxl problem.

Let  $X = \{0, 1, 2, ..., 15\}$ , and consider the equivalence relations  $\alpha_1, ..., \alpha_5$  and  $\beta$ , generating the following sublattice of Eq(X):

where  $\alpha_1, \ldots, \alpha_5$ , and  $\beta$  correspond to the following partitions of X:

	$\alpha_1$				$\alpha_2$				$\alpha_3$		
[0	1	2	3]	[0	4	8	12]	[0	5	10	15]
[4]	5	6	7]	[1	5	9	13]	[1	4	11	14
[8	9	10	11]	[2	6	10	14]	[2	7	8	13]
[12]	13	14	15]	[3	7	11	15	[3	6	9	12]

	$\alpha_4$				$\alpha_5$				$\beta$		
[0	7	9	14	[0	6	11	13]	[0	5	10	15]
[1	6	8	15]	[1	7	10	12		[1	4]	
[2	5	10	12	[2	4	9	15]		[2	8]	
[3	4	11	13]	[3	5	8	14]		[3	12	
									[6	9]	
									[7	13]	
									[11	14	

The relations  $\alpha_1, \ldots, \alpha_5$  are pairwise permuting pairwise complements (PPPC). Also, for each  $\alpha_i$ , with  $i \neq 3$ , it's clear that  $\beta$  and  $\alpha_i$  are nonpermuting complements. Here are some other facts that aid intuition.

**Fact A.1.** Each  $M_3$  sublattice with all  $\alpha$ 's for atoms is a congruence lattice. In other words, if i, j, k are three distinct numbers from the set  $\{1, 2, ..., 5\}^3$ , then the sublattice  $\{0_X, \alpha_i, \alpha_j, \alpha_k, 1_X\}$  is closed.

**Fact A.2.** Consider any  $M_4$  having all  $\alpha$ 's for atoms. The closure is the  $M_5$  lattice  $\{0_X, \alpha_1, \ldots, \alpha_5, 1_X\}$ .

**Fact A.3.** Each  $M_4$  generated by  $\beta$  and three  $\alpha$ 's complementary to  $\beta$  is not closed. The closure will have many relations in it.

Regarding the last fact, I've forgotten how many relations are in the closure.

TODO: Check this; also check whether  $\alpha_3$  and the other omitted  $\alpha$  always end up in the closure.

**Fact A.4.** The  $M_3$  sublattice  $\{0_X, \alpha_1, \alpha_2, \beta, 1_X\}$  is closed.

**Fact A.5.** The relation  $\tau = \tau(\alpha_1, \alpha_2, \beta)$  defined via the Wheatstone Bridge (Figure 2) is a subset of  $\beta$ .

What follows is an informal discussion of the motivation that lead to the relation  $\beta$  given in this example. (It is verbose and inelegant and will be removed eventually.)

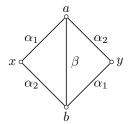

FIGURE 2. The Wheatstone Bridge which defines the relation  $\tau(\alpha_1, \alpha_2, \beta)$  as follows:  $(x, y) \in \tau(\alpha_1, \alpha_2, \beta)$  if and only if there exist  $a, b \in X$  satisfying the relations in the diagram.

Regarding the last fact,  $\beta$  was constructed specifically to provide a nontrivial example where such a fact would hold. That is, we wanted to know if there was an example where  $\beta$  has smaller height than  $\alpha_i$  (so that  $|x/\beta| \leq |y/\alpha_i| < \# \mathrm{Blocks}(\beta)$ , and so  $\beta$  would not permute with  $\alpha_1$  and  $\alpha_2$ ), and such that  $\tau(\alpha_1, \alpha_2, \beta) \subseteq \beta$ , so that the Wheatstone Bridge of Figure 2 would not generate an equivalence relation that isn't already contained in  $\{0_X, \alpha_1, \alpha_2, \beta, 1_X\}$ .

To construct  $\beta$ , we started by assuming  $0/\beta = \{0, 5, 10, 15\}$ , which is the main diagonal of both  $\alpha_1$  and  $\alpha_2$ . Then we considered the Wheatstone Bridge involving  $\alpha_1$  and  $\alpha_2$  and noticed that, if  $\tau \subseteq \beta$ , then  $\beta$  must contain all pairs that are at "opposite corners" (defined below) relative to pairs on the main diagonal  $\{0, 5, 10, 15\}$ .

By "opposite corners" we mean the following. Fix a pair in  $\beta$ , say,  $(0, 10) \in \beta$ , and consider the squares this pair generates in  $\alpha_1$  and  $\alpha_2$ ; that is, the squares with 0 and 10 at diagonal corners. We see that 2 and 8 appear at the remaining corners of such squares. We call the corners labeled 2 and 8 the "opposite corners" relative to 0 and 10.

The relation  $\tau$  defined by the Wheatstone Bridge satisfies

$$0 \tau 10 \longleftrightarrow 2 \tau 8.$$

Let us make this more general and precise. Recall the relation  $\tau = \tau(\alpha_1, \alpha_2, \beta) \subseteq X \times X$  is defined by

$$(A.1) x \tau y \longleftrightarrow (\exists (a,b) \in \beta) x \alpha_1 a \alpha_2 y \alpha_1 b \alpha_2 x.$$

Graphically,  $x \tau y$  if and only if there exist  $a, b \in X$  satisfying the relations depicted in Figure 2.

Let us order the elements of the equivalence classes of  $\alpha_1$  and  $\alpha_2$  according to the row-column arrangements given in the array representations above, and denote by  $\alpha_1(i,j)$  the j-th element of the i-th equivalence class of  $\alpha_1$ —that is  $\alpha_1(i,j)$  is the element in row i and column j of the array representation of  $\alpha_1$ .

Consider the Wheatstone Bridge diagram and note that, if (x, y) and (a, b) satisfy this diagram, so that (A.1) holds, then we have

(A.2) 
$$x \in a/\alpha_1 \cap b/\alpha_2$$
 and  $y \in b/\alpha_1 \cap a/\alpha_2$ .

Suppose  $a = \alpha_1(i, j)$  and  $b = \alpha_2(k, \ell)$ . Then, by (A.2), x is the point where the i-th row of  $\alpha_1$  intersects the k-th row of  $\alpha_2$ . But notice that, in this example, the array representing  $\alpha_2$  happens to be the transpose of the array representing  $\alpha_1$ . Therefore, the k-th row of  $\alpha_2$  is the k-th column of  $\alpha_1$ , so x is the element

contained in the *i*-th row and *k*-th column of  $\alpha_1$ , that is,  $x = \alpha_1(i, k)$ . Similarly,  $y = \alpha_1(j, \ell)$ . More generally, for all i, j, r, s in  $\{1, 2, 3, 4\}$ , we have

$$\alpha_1(i,j) \beta \alpha_1(r,s) \longrightarrow \alpha_1(i,s) \tau \alpha_1(j,r).$$

For example, looking at the array representing  $\alpha_1$ , we see that if, say, (2,15) were to belong to  $\beta$ , then the pair (3,15) at the opposite corners must belong to  $\tau$ .

## APPENDIX B. LIST OF ACRONYMS

**PPPC:** pairwise permuting pairwise complements
